

# From UML to SystemC: Intensive signal processing application

Jean-Luc Dekeyser

[dekeyser@lifl.fr](mailto:dekeyser@lifl.fr)

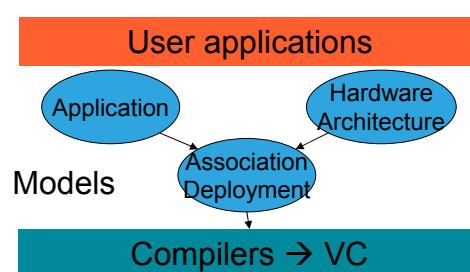

<http://www.lifl.fr/west/>

## « Y » model for SoC design

- 3 models
  - ISP applications
  - Target architectures
  - Mapping of applications on architectures

- Model separation allows reuse
- Typical programming techniques in SoC design

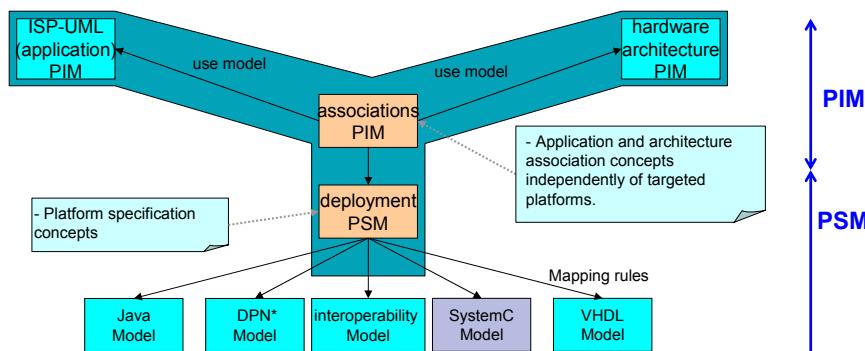

# Model Driven Engineering

- Model Driven Architecture (MDA) approach for SoC design
- PIM to PIM transformation mapping/scheduling
- Automatic generation of high-level SystemC specifications from ISP description
  - PIM to PSM transformation
  - Platform description model of SystemC ISP domain
- Profiling and performance evaluation
- Toward SW/HW co-design
  - Modeling at different abstraction levels
  - Ensures bit accuracy and cycle accuracy
  - Industrial IP libraries (VIPLibrary:ST, ARM, ...) and academic (SoCLib)

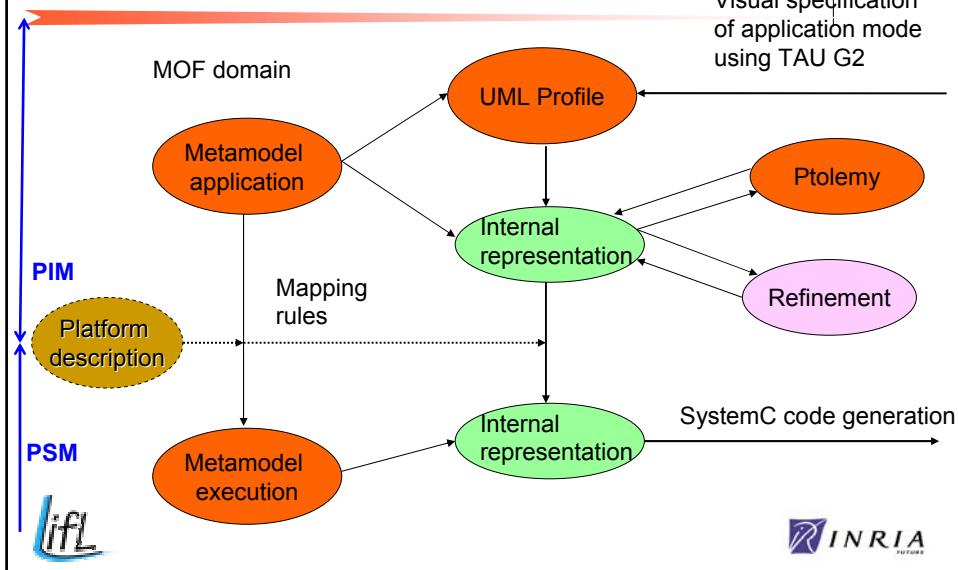

## The “Y” Model and MDA: Metamodel View

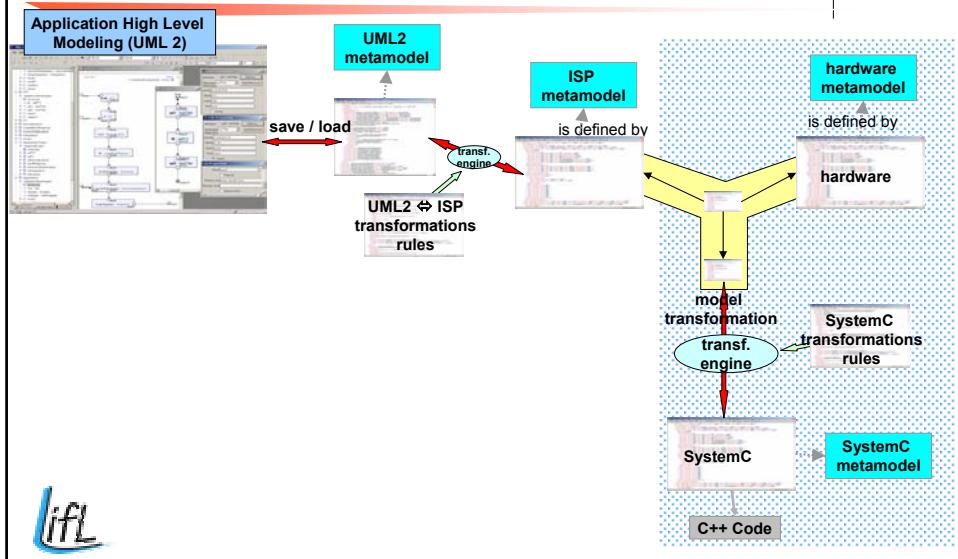

# Model Driven Engineering for ISP

Visual specification  
of application mode  
using TAU G2

## Model to Model Transformations ISP $\leftrightarrow$ SystemC

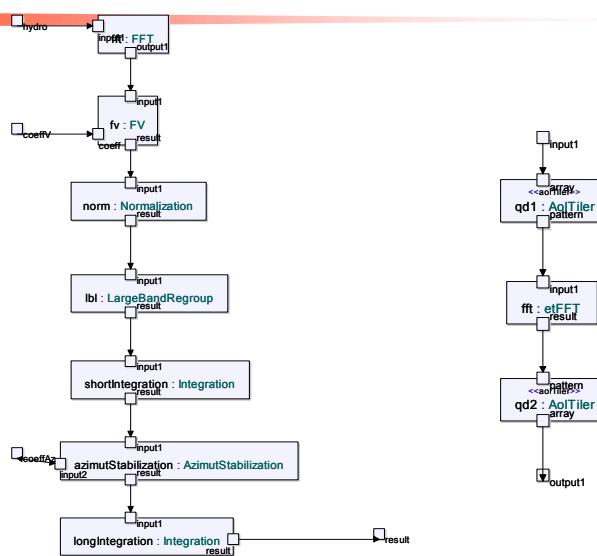

# Status

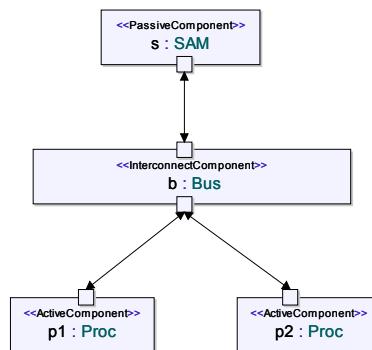

- Visual modeling of Intensive Signal Processing Application
- Eclipse Plugin
- Metamodel and UML profile of ISP
- Model to model transformation and code generation
  - UML TAU G2 <-> ISP
  - ISP -> SystemC
- ISP domain in SystemC ( KPN execution model)
- Distributed SystemC runtime
  - Socket
  - Corba
- Multi abstraction level SystemC simulation

## Application PIM: ISP Example

## BiProcessor with SAM

INRIA  
FUTURIA

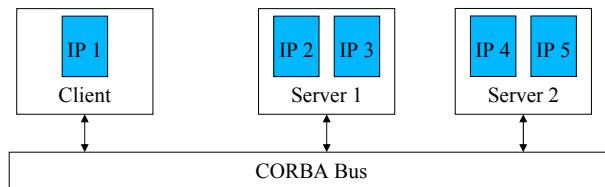

The screenshot shows the Eclipse Platform interface with several open views and editors:

- Left View (VBLisp.xml):** Shows the XML structure of the VBLisp project, including sections for Root, VBL, Display, VBLWrapper, Application, Normalization, arrays, elementaryTasks, FV, FFT, and VBL.
- Middle Left View (VBLisp.transform.xml):** Shows the XML structure of the VBLisp.transform file, including sections for Root, Array200x192, Array192x512, ft: FFT, VBL, AzimutStabilization, Integration, FFT, elementaryTasks, GeneratedComponents, fusion FFT - FV, Ports, and Parts.
- Middle Right View (Application Models):** Shows the Application Models view with a tree structure under test, models, Application, VBLisp.transform.xml, and VBLisp.xml.
- Bottom Left View (assoc\_vbl\_archi\_test.xml):** Shows the XML structure of the assoc\_vbl\_archi\_test file, including sections for Root, association, CodeMapping, sched\_qd2\_qd1, DataMapping, sched\_qd1\_qd2, VBL, and archi\_test.
- Bottom Middle View (Association Models):** Shows the Association Models view with a tree structure under test, models, Association, and Assoc\_vbl\_archi\_test.xml.
- Bottom Right View (SystemC Models):** Shows the SystemC Models view with a tree structure under test, models, SystemC, and SystemC\_assoc\_vbl\_archi\_test.xml.
- Bottom Bottom View (C++ Autogenerated Code):** Shows the C++ Autogenerated Code view with a tree structure under test.

# Distributed SystemC in CORBA

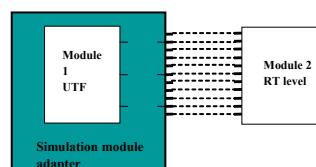

- IPs are available on server hosts
- Each IP or IP group must be encapsulated in a SystemC module (corba\_server\_if)
- Transport object : remote method invocation on CORBA bus (set/get on ports)
- Clocked modules to support synchronization of distributed IPs

# SystemC multi-abstraction level

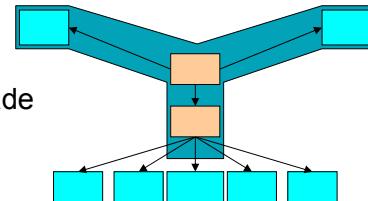

- What : Connecting together IPs described at different abstraction levels
- Why : Easy and fast simulation platform with existing IPs
- How : Data conversion and protocol conversion
  - Construction of level adapters by rule compositions (No library)
    - Transformation rules (transformation of the ports)
    - Association rules (transformation and definition of ports protocols)

## Future works

- A Full « Y-model »
  - Extend ISP model with control-flow model (estrel)
  - Hardware hierarchical specification (Syndex oriented)
  - Mapping specification and optimization techniques
- A MDA style
  - MOF definition of metamodels
  - MDATransf tool
  - Mapping rules towards Esterel/scade
  - PDM of SystemC ISP domain
  - Multi-language PSM, Multi-PSM

## Collaborations

- UML2.0 Profil
  - P2I Itea Project
  - PROTES (Carroll Inria, CEA, Thales)
  - Standardisation action at OMG
- Around SystemC
  - Collaboration with Irvine (D Gajski) SpecC
  - TIMA Grenoble (Dynamic scheduling)
  - Soclib
  - EuroSoc
  - ECSI
